IMPORTANT: BEFORE PROGRAMMING FOR THE FIRST
TIME THE RADIO RECEIVER, DELETE ALL THE RECORDED TEST CODES. SEE FUNCTION r $\quad$ AT THE BOTTOM OF THIS CHAPTER

## IN CASE OF TRANSMITTERS WITH DIP-SWITCHES, SET THE

(For security reasons avoid to set the microswitches all in OFF or all in ON position)
IN CASE OF HIT TYPE TRANSMITTERS, THE ABOVE MENTIONED PROCEDURE IS NOT NECESSARY BECAUSE EACH TRANSMITTER COMES WITH ITS OWN CODE RANDOM.

F = DISPLAYING STORED CODES

- Press the button A repeatedly until the display shows $\quad$ Press button B until the display shows
The display will now cycle trough each stored code from 01 to 50
O ERASEASIN DE SOD

STORING NEW REMOTE CONTROL CODE

-     - Press the button A repeatedly until the display shows
- Press button B until the display shows $\mathcal{L} \mathscr{C}_{\text {til }}$
- Press and hold the remote control button $n$ appears on the display (this
means that the receiver is ready to store a new code) and simultaneously means that the receiver is ready to store a new code) and simultaneously press button C to store the new code
- STORING NEW REMOTE CONTROL CODE with STOP function
- Press the button A repeatedly until the display shows $r$,
- Press button B until the display shows $[$ Pr and simultaneously press button C to store the new code.

81
STORING NEW REMOTE CONTROL CODE with PEDESTRIAN function Press the button A repeatedly until the display shows $\quad$ R
Press and hold the remote control butfon until the dot appears on the display and simultaneously press button C to store the new code

- DELETINGALLSTOREDCODES

L - Press the button A repeatedly until the display shows $A$
Press button B until the display shows -5
This indicates that all the codes have been erased

WARNING:
Before proceeding with the control board commissioning, check which kind of limit The contralled on the motor.

\section*{| $F$ | $\rightarrow \mathrm{NO}$ |
| :--- | :--- | <br> n case of magnetic limit switch please select parameter:}

| $\boldsymbol{F}$ | $\rightarrow$ YES |
| :--- | :--- |

## ethod 1 = STANDARD

Method 2 = SEQUENTIAL

## Warning

Before powering up and programming the control unit refer to the wiring scheme and then
1 Check that the motor connections are correct
Check that the photocell connections are correct
Important:
If the photocells are not installed in closing phase, you must link terminals 3 and 9
phase, you must link terminals 4 and 9 .
Important:
If an emergency stop button is not fitted, you must link terminals 2 and 8 .
4 Use the motor release key supplied to disengage the electric motor from the mechanical drive; then close the gate and re-engage.
5 Power the control unit up

## STANDARD PROGRAMMING PROCESS (Method 1)

a) Give a START signal (terminal 1 and terminal 8)

After an opening movement of about 240 mm , the deceleration phase will start (since the control board is pre-adjusted for an opening of $2,50 \mathrm{~m}$ ). T
he motor will wait about 3 seconds and after that will start again with the closing phase
b) Give a START signal to verify which functions and times are not suitable with the installation and take note.
c) Enter the programming phase through the buttons $\mathbf{A}$ and $\mathbf{B}$ to reach the wished parameter
Use the buttons $\mathbf{C}$ and $\mathbf{D}$ to change or confirm every single parameter
e) IMPORTANT: save the changes by selecting the parameter $5 \|$ and pushing the
button $\mathbf{C}$.

Example:
ncrease the motor working time by 5 seconds

The motor working time has been increased from 21 to 26 seconds

## SEQUENTIAL PROGRAMMING (method 2)

## SLIDING GATE SEQUENTIAL PROGRAMMING

a) Press button A (steps through the top menu) until the display shows 85
b) Press button $\mathbf{B}$ (steps through the sub-menu) until the display shows iff
c) Give a START signal: the leaf starts opening and the display shows 71
d) Wait until the leaf has done the $90 \%$ of the opening cycle and then give another START signal: the display shows r| and the deceleration phase begins.
When the opening phase has been completed (OPENING LIMIT SWITCH) and the display shows $L \Gamma$, the control board has stored the SWening and the display shows $L$ r, the control board has stored the (pause) time
f) At the reaching of the desired pause time, give another START impulse. The control board has stored the "stay open" time and the gate starts the closing cycle.
g) When the closing cycle has completely finished, till the complete closure of the gate, the control unit automatically exits from the sequentia programming process and all the working times have been saved

## SELF-DIAGNOSIS DISPLAY MESSAGES

Photocell's test erro
PHOTOCELL OR SAFETY RUBBER EDGE N OPENING PHASE

Closing phase photoce beam interruote or wiring fault
Both opening and closing phase photocell beam nterrupted or wiring fault
Stop pressed
(or open circuit between
terminal $2 \& 8$ )

Limit switch Limit switch
in opening phase Limit switch
in closing phase

Pedestrian start signal (short circuit between terminal7 \& 8) Start signal (short circuit between terminal 1 \& 8) Radio fob trasmitting

## SPECIAL FUNCTIONS

## [1 I AUTOMATIC CLOSING FUNCTION

When set to YES ("Sl"):

- an impulse during the opening phase will stop the motors until another impulse is received an impulse during the closing phase will stop and reverse the motors

When set to NO, the step-by-step operation is active:

- $1^{\text {st }}$ impulse starts the opening phase
- $3^{\text {rd }}$ impulse starts the closing phase

## PI mutr-userfunction

when set to YES ("SI"). The control unit will not accept any command during the opening phase

Motor problem (wiring
fault, obstruction or forque setting too low)

Terminal block 2

## EARTH TERMINAL BLOCK CONNECTIONS

Connect the yellow/green motors cable to earth terminal $\mathbf{A}$.

## Connect the yellow/green network cable to earth terminal $B$

## TERMINAL BLOCK 2 CONNECTIONS

1-8 Start control normally open (NA) for button, key selector, radio receiver or Timer clock connection.
The Start control starts the programmed running cycle.
2-8 Stop control normally closed (NC). Emergency button
When pressed the gate stops immediately.
In Opening phase and Break-time: at the first impulse the gate closes.
Closing phase: at the first impulse the gate opens
inal 2 with terminal 8 .
nput of safety rubber edges and of safety photocell in closing phase.
Input of several safety photocells in closing phase
The receiver contacts must be connected in series. Normally closed (NC).
In opening phase: does not work
In closing phase: Stop, break-time for 2 seconds, opening phase again.
If, temporarily, the photocell contacts are not used, link terminal 3 with terminal 9
3-9 Input only for safety rubber edges in closing phase
The contacts must be connected in series if there is more than one safety rubber edge
Normally closed (NC)
g phase: does not work.
In closing phase: Stop, break-time for 2 seconds, opening phase again
ty photocells in opening phase (for sliding gate)

In closing phase: does not work
If you also want to connect the safety rubber edges, you must connect in series their contacts with the photocell ones.
If, temporarily, the photocell contacts are not used, link terminal 4 with terminal 9 .
4-9 Input safety rubber edges in opening phase (for sliding gate)
Normally closed (NC).
ops and changes direction for 3 seconds
closing phase: does not work
號 6-8 Limit switch input in opening phase.
7-8 $\quad$ Pedestrian start input. Normally open (NA).Only one leaf start to open
8-10 Output for photocell receiver power supply.
Output for extra 24 V dc accessories power supply
With all Standard accessories included 100 mA are still available for extra accessories.
9-10 Output for photocell transmitter power supply.
11-12 Blinker intermittent output. 24V 20W max.

6 CONNECTING PHOTOCELL IN CLOSING PHASE

PHOTOCELLS CONNECTIONS
8 = Power supply + PHOTO RX $9=$ Power supply + PHOTO TX
$10=$ Power supply - COM. PHOTO TXIRX

3-8 = Connections photocells

3-9: Link terminals 3 and 9 if the photocells are not used in the closing phase.

CONNECTING PHOTOCELL IN OPENING PHASE

[^0]:    13-14-15 $\begin{array}{ll}\text { Motor M1- output } \\ & \text { The motor is assembled to be fixed on the right side of the gate (looking from inside) }\end{array}$
    TERMINAL BLOCK 3 CONNECTIONS

    If you need to fix it on the left side of the gate and the motor has electromechanical limit switch system, you have to swap motor wires 13 with 15 and limit switch wires 5 with 6 . Capacitor between plugs 13 and 15 .
    If you need to fixit on the left side of the gate and the motor has magnetic limit switch system, you have to swap motor wires 13 with 15 and keep unchanged the limit switch wires. PLEASE PAY ATTENTION TO REVERSE THE MAGNET SUPPORTS. Capacitor between plugs 13 and 15 .
